

Embedding of the Theory of Abstract Objects in Isabelle/HOL

Daniel Kirchner

May 27, 2017

Abstract

This document constitutes a core contribution of the MSc project of Daniel Kirchner. The supervisor of this project is Christoph Benzmüller. The project idea results from an ongoing collaboration between Benzmüller and Zalta since 2015 and from the Computational Metaphysics lecture course held at FU Berlin in 2016.

1 Embedding

1.1 Primitives

typeddecl i — possible worlds

typeddecl j — states

consts $dw :: i$ — actual world

consts $dj :: j$ — actual state

typeddecl ω — ordinary objects

typeddecl σ — special urelements

datatype $v = \omega v \ \omega \mid \sigma v \ \sigma$ — urelements

1.2 Derived Types

typedef $o = UNIV :: (j \Rightarrow i \Rightarrow bool)$ set

morphisms $eval_o \ make_o ..$ — truth values

type-synonym $\Pi_0 = o$ — zero place relations

typedef $\Pi_1 = UNIV :: (v \Rightarrow j \Rightarrow i \Rightarrow bool)$ set

morphisms $eval_{\Pi_1} \ make_{\Pi_1} ..$ — one place relations

typedef $\Pi_2 = UNIV :: (v \Rightarrow v \Rightarrow j \Rightarrow i \Rightarrow bool)$ set

morphisms $eval_{\Pi_2} \ make_{\Pi_2} ..$ — two place relations

typedef $\Pi_3 = UNIV :: (v \Rightarrow v \Rightarrow v \Rightarrow j \Rightarrow i \Rightarrow bool)$ set

morphisms $eval_{\Pi_3} \ make_{\Pi_3} ..$ — three place relations

type-synonym $\alpha = \Pi_1$ set — abstract objects

datatype $\nu = \omega \nu \ \omega \mid \alpha \nu \ \alpha$ — individuals

typedef $\kappa = UNIV :: (\nu \ option)$ set

morphisms $eval_{\kappa} \ make_{\kappa} ..$ — individual terms

setup-lifting *type-definition-o*

setup-lifting *type-definition- κ*

setup-lifting *type-definition- Π_1*
setup-lifting *type-definition- Π_2*
setup-lifting *type-definition- Π_3*

1.3 Individual Terms and Definite Descriptions

Remark 1. *Individual terms can be definite descriptions which may not denote. Therefore the type for individual terms κ is defined as ν option. Individuals are represented by *Some* x for an individual x of type ν , whereas non-denoting individual terms are represented by *None*. Note that relation terms on the other hand always denote, so there is no need for a similar distinction between relation terms and relations.*

lift-definition $\nu\kappa :: \nu \Rightarrow \kappa \text{ } (-^P \text{ } [90] \text{ } 90)$ **is** *Some* .

lift-definition *proper* $:: \kappa \Rightarrow \text{bool}$ **is** $op \neq \text{None}$.

lift-definition *rep* $:: \kappa \Rightarrow \nu$ **is** *the* .

Remark 2. *Individual terms can be explicitly marked to only range over logically proper objects (e.g. x^P). Their logical propriety and (in case they are logically proper) the represented individual can be extracted from the internal representation as ν option.*

lift-definition *that::* $(\nu \Rightarrow o) \Rightarrow \kappa$ (**binder** ι $[8] \text{ } 9$) **is**

$\lambda \varphi . \text{if } (\exists ! x . (\varphi x) \text{ } dj \text{ } dw)$
 $\quad \text{then } \text{Some } (THE x . (\varphi x) \text{ } dj \text{ } dw)$
 $\quad \text{else } \text{None} .$

Remark 3. *Definite descriptions map conditions on individuals to individual terms. If no unique object satisfying the condition exists (and therefore the definite description is not logically proper), the individual term is set to *None*.*

1.4 Mapping from objects to urelements

consts $\alpha\sigma :: \alpha \Rightarrow \sigma$

axiomatization where $\alpha\sigma\text{-surj}$: *surj* $\alpha\sigma$

definition $\nu\nu :: \nu \Rightarrow \nu$ **where** $\nu\nu \equiv \text{case-}\nu \text{ } \omega\nu \text{ } (\sigma\nu \circ \alpha\sigma)$

1.5 Exemplification of n-place relations.

lift-definition *exe0::* $\Pi_0 \Rightarrow o$ ($\langle _ \rangle$) **is** *id* .

lift-definition *exe1::* $\Pi_1 \Rightarrow \kappa \Rightarrow o$ ($\langle _, _ \rangle$) **is**

$\lambda F x s w . (\text{proper } x) \wedge F (\nu\nu (\text{rep } x)) s w .$

lift-definition *exe2::* $\Pi_2 \Rightarrow \kappa \Rightarrow \kappa \Rightarrow o$ ($\langle _, _, _ \rangle$) **is**

$\lambda F x y s w . (\text{proper } x) \wedge (\text{proper } y) \wedge$
 $F (\nu\nu (\text{rep } x)) (\nu\nu (\text{rep } y)) s w .$

lift-definition *exe3::* $\Pi_3 \Rightarrow \kappa \Rightarrow \kappa \Rightarrow \kappa \Rightarrow o$ ($\langle _, _, _, _ \rangle$) **is**

$\lambda F x y z s w . (\text{proper } x) \wedge (\text{proper } y) \wedge (\text{proper } z) \wedge$
 $F (\nu\nu (\text{rep } x)) (\nu\nu (\text{rep } y)) (\nu\nu (\text{rep } z)) s w .$

Remark 4. *An exemplification formula can only be true if all individual terms are logically proper. Furthermore exemplification depends on the urelement corresponding to the individual, not the individual itself.*

1.6 Encoding

lift-definition *enc* $:: \kappa \Rightarrow \Pi_1 \Rightarrow o$ ($\langle _, _ \rangle$) **is**

$\lambda x F s w . (\text{proper } x) \wedge \text{case-}\nu (\lambda \omega . \text{False}) (\lambda \alpha . F \in \alpha) (\text{rep } x) .$

Remark 5. *An encoding formula can again only be true if the individual term is logically proper. Furthermore ordinary objects never encode, whereas abstract objects encode a property if and only if the property is contained in it as per the Aczel Model.*

1.7 Connectives and Quantifiers

consts $I\text{-}NOT :: j \Rightarrow (i \Rightarrow \text{bool}) \Rightarrow i \Rightarrow \text{bool}$

consts $I\text{-}IMPL :: j \Rightarrow (i \Rightarrow \text{bool}) \Rightarrow (i \Rightarrow \text{bool}) \Rightarrow (i \Rightarrow \text{bool})$

lift-definition $\text{not} :: o \Rightarrow o \rightarrow (\neg \cdot [54] \ 70)$ **is**

$\lambda p \ s \ w . s = dj \wedge \neg p \ dj \ w \vee s \neq dj \wedge (I\text{-}NOT \ s \ (p \ s) \ w) .$

lift-definition $\text{impl} :: o \Rightarrow o \Rightarrow o \rightarrow (\text{infixl} \rightarrow 51)$ **is**

$\lambda p \ q \ s \ w . s = dj \wedge (p \ dj \ w \longrightarrow q \ dj \ w) \vee s \neq dj \wedge (I\text{-}IMPL \ s \ (p \ s) \ (q \ s) \ w) .$

lift-definition $\text{forall}_\nu :: (\nu \Rightarrow o) \Rightarrow o \rightarrow (\text{binder} \ \forall_\nu \ [8] \ 9)$ **is**

$\lambda \varphi \ s \ w . \forall x :: \nu . (\varphi \ x) \ s \ w .$

lift-definition $\text{forall}_0 :: (\Pi_0 \Rightarrow o) \Rightarrow o \rightarrow (\text{binder} \ \forall_0 \ [8] \ 9)$ **is**

$\lambda \varphi \ s \ w . \forall x :: \Pi_0 . (\varphi \ x) \ s \ w .$

lift-definition $\text{forall}_1 :: (\Pi_1 \Rightarrow o) \Rightarrow o \rightarrow (\text{binder} \ \forall_1 \ [8] \ 9)$ **is**

$\lambda \varphi \ s \ w . \forall x :: \Pi_1 . (\varphi \ x) \ s \ w .$

lift-definition $\text{forall}_2 :: (\Pi_2 \Rightarrow o) \Rightarrow o \rightarrow (\text{binder} \ \forall_2 \ [8] \ 9)$ **is**

$\lambda \varphi \ s \ w . \forall x :: \Pi_2 . (\varphi \ x) \ s \ w .$

lift-definition $\text{forall}_3 :: (\Pi_3 \Rightarrow o) \Rightarrow o \rightarrow (\text{binder} \ \forall_3 \ [8] \ 9)$ **is**

$\lambda \varphi \ s \ w . \forall x :: \Pi_3 . (\varphi \ x) \ s \ w .$

lift-definition $\text{forall}_o :: (o \Rightarrow o) \Rightarrow o \rightarrow (\text{binder} \ \forall_o \ [8] \ 9)$ **is**

$\lambda \varphi \ s \ w . \forall x :: o . (\varphi \ x) \ s \ w .$

lift-definition $\text{box} :: o \Rightarrow o \rightarrow (\Box \cdot [62] \ 63)$ **is**

$\lambda p \ s \ w . \forall v . p \ s \ v .$

lift-definition $\text{actual} :: o \Rightarrow o \rightarrow (\mathcal{A} \cdot [64] \ 65)$ **is**

$\lambda p \ s \ w . p \ s \ dw .$

Remark 6. *The connectives behave classically if evaluated for the actual state dj , whereas their behavior is governed by uninterpreted constants for any other state.*

1.8 Lambda Expressions

Remark 7. *Lambda expressions have to convert maps from individuals to propositions to relations that are represented by maps from urelements to truth values.*

lift-definition $\text{lambdabinder0} :: o \Rightarrow \Pi_0 \ (\lambda^0)$ **is** $\text{id} .$

lift-definition $\text{lambdabinder1} :: (\nu \Rightarrow o) \Rightarrow \Pi_1 \ (\text{binder} \ \lambda \ [8] \ 9)$ **is**

$\lambda \varphi \ u \ s \ w . \exists x . \nu v \ x = u \wedge \varphi \ x \ s \ w .$

lift-definition $\text{lambdabinder2} :: (\nu \Rightarrow \nu \Rightarrow o) \Rightarrow \Pi_2 \ (\lambda^2)$ **is**

$\lambda \varphi \ u \ v \ s \ w . \exists x \ y . \nu v \ x = u \wedge \nu v \ y = v \wedge \varphi \ x \ y \ s \ w .$

lift-definition $\text{lambdabinder3} :: (\nu \Rightarrow \nu \Rightarrow \nu \Rightarrow o) \Rightarrow \Pi_3 \ (\lambda^3)$ **is**

$\lambda \varphi \ u \ v \ r \ s \ w . \exists x \ y \ z . \nu v \ x = u \wedge \nu v \ y = v \wedge \nu v \ z = r \wedge \varphi \ x \ y \ z \ s \ w .$

1.9 Proper Maps from Individual Terms to Propositions

Remark 8. *The embedding introduces the notion of proper maps from individual terms to propositions.*

Such a map is proper if and only for all proper individual terms its truth evaluation in the actual state only depends on the urelement corresponding to the individual the term denotes. Proper maps are exactly those maps that - when used in a lambda-expression - unconditionally allow beta-reduction.

lift-definition $\text{IsProperInX} :: (\kappa \Rightarrow o) \Rightarrow \text{bool}$ **is**

$\lambda \varphi . \forall x \ v . (\exists a . \nu v \ a = \nu v \ x \wedge (\varphi \ (a^P) \ dj \ v)) = (\varphi \ (x^P) \ dj \ v) .$

lift-definition $\text{IsProperInXY} :: (\kappa \Rightarrow \kappa \Rightarrow o) \Rightarrow \text{bool}$ **is**

$\lambda \varphi . \forall x \ y \ v . (\exists a \ b . \nu v \ a = \nu v \ x \wedge \nu v \ b = \nu v \ y$
 $\wedge (\varphi \ (a^P) \ (b^P) \ dj \ v)) = (\varphi \ (x^P) \ (y^P) \ dj \ v) .$

lift-definition $\text{IsProperInXYZ} :: (\kappa \Rightarrow \kappa \Rightarrow \kappa \Rightarrow o) \Rightarrow \text{bool}$ **is**

$\lambda \varphi . \forall x \ y \ z \ v . (\exists a \ b \ c . \nu v \ a = \nu v \ x \wedge \nu v \ b = \nu v \ y \wedge \nu v \ c = \nu v \ z$
 $\wedge (\varphi \ (a^P) \ (b^P) \ (c^P) \ dj \ v)) = (\varphi \ (x^P) \ (y^P) \ (z^P) \ dj \ v) .$

1.10 Validity

lift-definition *valid-in* :: $i \Rightarrow o \Rightarrow \text{bool}$ (**infixl** \models 5) is
 $\lambda v \varphi . \varphi \text{ dj } v .$

Remark 9. A formula is considered semantically valid for a possible world, if it evaluates to True for the actual state dj and the given possible world.

1.11 Concreteness

consts *ConcreteInWorld* :: $\omega \Rightarrow i \Rightarrow \text{bool}$

abbreviation (input) *OrdinaryObjectsPossiblyConcrete* **where**
 $\text{OrdinaryObjectsPossiblyConcrete} \equiv \forall x . \exists v . \text{ConcreteInWorld } x v$

abbreviation (input) *PossiblyContingentObjectExists* **where**
 $\text{PossiblyContingentObjectExists} \equiv \exists x v . \text{ConcreteInWorld } x v$
 $\wedge (\exists w . \neg \text{ConcreteInWorld } x w)$

abbreviation (input) *PossiblyNoContingentObjectExists* **where**
 $\text{PossiblyNoContingentObjectExists} \equiv \exists w . \forall x . \text{ConcreteInWorld } x w$
 $\longrightarrow (\forall v . \text{ConcreteInWorld } x v)$

axiomatization **where**

OrdinaryObjectsPossiblyConcreteAxiom:

OrdinaryObjectsPossiblyConcrete

and *PossiblyContingentObjectExistsAxiom:*

PossiblyContingentObjectExists

and *PossiblyNoContingentObjectExistsAxiom:*

PossiblyNoContingentObjectExists

Remark 10. In order to define concreteness, care has to be taken that the defined notion of concreteness coincides with the meta-logical distinction between abstract objects and ordinary objects. Furthermore the axioms about concreteness have to be satisfied. This is achieved by introducing an uninterpreted constant *ConcreteInWorld* that determines whether an ordinary object is concrete in a given possible world. This constant is axiomatized, such that all ordinary objects are possibly concrete, contingent objects possibly exist and possibly no contingent objects exist.

lift-definition *Concrete:: Π_1* (*E!*) is

$\lambda u s w . \text{case } u \text{ of } \omega v x \Rightarrow \text{ConcreteInWorld } x w \mid - \Rightarrow \text{False} .$

Remark 11. Concreteness of ordinary objects is now defined using this axiomatized uninterpreted constant. Abstract objects on the other hand are never concrete.

1.12 Collection of Meta-Definitions

The meta-logical definitions are collected with the theorem attribute *meta-defs*.

named-theorems *meta-defs*

declare *not-def*[*meta-defs*] *impl-def*[*meta-defs*] *forall_v-def*[*meta-defs*]

unfolding *IsProperInXYZ-def*

by (*auto simp: meta-defs meta-aux*)

method *show-proper* = (*fast intro: IsProper-intros*)

The proving method *show-proper* is defined and is used in the subsequent theory whenever it is necessary to show that a map is proper.

2.3 Validity Syntax

abbreviation *validity-in* :: $\text{o} \Rightarrow i \Rightarrow \text{bool}$ ($[- \text{ in } -] [1]$) **where**
validity-in $\equiv \lambda \varphi \ v \ . \ v \models \varphi$
definition *actual-validity* :: $\text{o} \Rightarrow \text{bool}$ ($[-] [1]$) **where**
actual-validity $\equiv \lambda \varphi \ . \ dw \models \varphi$
definition *necessary-validity* :: $\text{o} \Rightarrow \text{bool}$ ($\Box[-] [1]$) **where**
necessary-validity $\equiv \lambda \varphi \ . \ \forall \ v \ . \ (v \models \varphi)$

3 General Quantification

Remark 13. *In order to define general quantifiers that can act on individuals as well as relations a type class is introduced which assumes the semantics of the all quantifier. This type class is then instantiated for individuals and relations.*

3.1 Type Class

Type class for quantifiable types:

```
class quantifiable = fixes forall :: ('a  $\Rightarrow$  o)  $\Rightarrow$  o (binder  $\forall$  [8] 9)
assumes quantifiable-T8: ( $w \models (\forall x \ . \ \psi \ x)$ ) = ( $\forall x \ . \ (w \models (\psi \ x))$ )
begin
end
```

Semantics for the general all quantifier:

```
lemma (in Semantics) T8: shows ( $w \models \forall x \ . \ \psi \ x$ ) = ( $\forall x \ . \ (w \models \psi \ x)$ )
using quantifiable-T8 .
```

3.2 Instantiations

```
instantiation  $\nu$  :: quantifiable
begin
definition forall- $\nu$  :: ( $\nu \Rightarrow$  o)  $\Rightarrow$  o where forall- $\nu \equiv$  forall $_{\nu}$ 
instance proof
fix w :: i and  $\psi$  ::  $\nu \Rightarrow$  o
show ( $w \models \forall x \ . \ \psi \ x$ ) = ( $\forall x \ . \ (w \models \psi \ x)$ )
unfolding forall- $\nu$ -def using Semantics.T8- $\nu$  .
qed
end
```

```
instantiation o :: quantifiable
begin
definition forall-o :: ( $\text{o} \Rightarrow$  o)  $\Rightarrow$  o where forall-o  $\equiv$  forall $_o$ 
instance proof
fix w :: i and  $\psi$  ::  $\text{o} \Rightarrow$  o
show ( $w \models \forall x \ . \ \psi \ x$ ) = ( $\forall x \ . \ (w \models \psi \ x)$ )
unfolding forall-o-def using Semantics.T8-o .
qed
end
```

```
instantiation  $\Pi_1$  :: quantifiable
begin
definition forall- $\Pi_1$  :: ( $\Pi_1 \Rightarrow$  o)  $\Rightarrow$  o where forall- $\Pi_1 \equiv$  forall $_1$ 
instance proof
```

```

fix w :: i and ψ :: Π1⇒o
show (w ⊨ ∀ x. ψ x) = (∀ x. (w ⊨ ψ x))
  unfolding forall-Π1-def using Semantics.T8-1 .
qed
end

instantiation Π2 :: quantifiable
begin
  definition forall-Π2 :: (Π2⇒o)⇒o where forall-Π2 ≡ forall2
  instance proof
    fix w :: i and ψ :: Π2⇒o
    show (w ⊨ ∀ x. ψ x) = (∀ x. (w ⊨ ψ x))
      unfolding forall-Π2-def using Semantics.T8-2 .
    qed
  end

instantiation Π3 :: quantifiable
begin
  definition forall-Π3 :: (Π3⇒o)⇒o where forall-Π3 ≡ forall3
  instance proof
    fix w :: i and ψ :: Π3⇒o
    show (w ⊨ ∀ x. ψ x) = (∀ x. (w ⊨ ψ x))
      unfolding forall-Π3-def using Semantics.T8-3 .
    qed
  end
end

```

4 Basic Definitions

4.1 Derived Connectives

```

definition conj::o⇒o⇒o (infixl & 53) where

$$\text{basic-identity}_2 \equiv \lambda F G . \forall x. ((\lambda y. \llbracket F, x^P, y^P \rrbracket) =_1 (\lambda y. \llbracket G, x^P, y^P \rrbracket))$$

$$\&\ ((\lambda y. \llbracket F, y^P, x^P \rrbracket) =_1 (\lambda y. \llbracket G, y^P, x^P \rrbracket))$$

definition *basic-identity₃* :: $\Pi_3 \Rightarrow \Pi_3 \Rightarrow o$ (**infixl** =₃ 63) **where**

$$\text{basic-identity}_3 \equiv \lambda F G . \forall x y. (\lambda z. \llbracket F, z^P, x^P, y^P \rrbracket) =_1 (\lambda z. \llbracket G, z^P, x^P, y^P \rrbracket)$$

$$\&\ (\lambda z. \llbracket F, x^P, z^P, y^P \rrbracket) =_1 (\lambda z. \llbracket G, x^P, z^P, y^P \rrbracket)$$

$$\&\ (\lambda z. \llbracket F, x^P, y^P, z^P \rrbracket) =_1 (\lambda z. \llbracket G, x^P, y^P, z^P \rrbracket)$$

definition *basic-identity₀* :: $o \Rightarrow o \Rightarrow o$ (**infixl** =₀ 63) **where**

$$\text{basic-identity}_0 \equiv \lambda F G . (\lambda y. F) =_1 (\lambda y. G)$$

5 MetaSolver

Remark 14. *meta-solver* is a resolution prover that translates expressions in the embedded logic to expressions in the meta-logic, resp. semantic expressions. The rules for connectives, quantifiers, exemplification and encoding are easy to prove. Furthermore rules for the defined identities are derived using more verbose proofs. By design the defined identities in the embedded logic coincide with the meta-logical equality.

6 General Identity

Remark 15. In order to define a general identity symbol that can act on all types of terms a type class is introduced which assumes the substitution property which is needed to state the axioms later. This type class is then instantiated for all applicable types.

6.1 Type Classes

```

class identifiable =
fixes identity :: 'a  $\Rightarrow$  'a  $\Rightarrow$  o (infixl = 63)
assumes l-identity:
   $w \models x = y \implies w \models \varphi x \implies w \models \varphi y$ 
begin
  abbreviation notequal (infixl  $\neq$  63) where
    notequal  $\equiv \lambda x y. \neg(x = y)$ 
end

class quantifiable-and-identifiable = quantifiable + identifiable
begin
  definition exists-unique::('a  $\Rightarrow$  o)  $\Rightarrow$  o (binder  $\exists!$  [8] 9) where
    exists-unique  $\equiv \lambda \varphi. \exists \alpha. \varphi \alpha \ \& \ (\forall \beta. \varphi \beta \rightarrow \beta = \alpha)$ 

  declare exists-unique-def[conn-defs]
end

```

7 The Axioms of Principia Metaphysica

Remark 17. *The axioms of PM can now be derived from the Semantics and the meta-logic.*

```

locale Axioms
begin
  interpretation MetaSolver .
  interpretation Semantics .
  named-theorems axiom

```

Remark 18. *The special syntax $[[\cdot]]$ is introduced for axioms. This allows to formulate special rules resembling the concepts of closures in PM. To simplify the instantiation of axioms later, special attributes are introduced to automatically resolve the special axiom syntax. Necessitation averse axioms are stated with the syntax for actual validity $[-]$.*

```

definition axiom :: o  $\Rightarrow$  bool ([[ - ]]) where axiom  $\equiv \lambda \varphi . \forall v . [\varphi \text{ in } v]$ 

method axiom-meta-solver = (((unfold axiom-def)?, rule allI) | (unfold actual-validity-def)?),
meta-solver,
(simp | (auto; fail))?)

7.3 Axioms of Identity

```

lemma l-identity[axiom]:
  [[ $\alpha = \beta \rightarrow (\varphi \ \alpha \rightarrow \varphi \ \beta)$ ]]
using l-identity apply - by axiom-meta-solver

```

7.4 Axioms of Quantification

Remark 19. *The axioms of quantification differ from the axioms in Principia Metaphysica. The differences can be justified, though.*

- Axiom *cqt-2* is omitted, as the embedding does not distinguish between terms and variables for relations. Instead it is combined with *cqt-1*, in which the corresponding condition is omitted, and with *cqt-5* in its modified form *cqt-5-mod*.
- Note that the all quantifier for individuals only ranges over type ν , which is always a denoting term and not a definite description in the embedding.
- The case of definite descriptions is handled separately in axiom *cqt-1- κ* : If a formula involving an object of type κ holds for all denoting terms $(\forall \alpha. \varphi(\alpha^P))$ then the formula holds for an individual term $\varphi \alpha$, if α denotes, i.e. $\exists \beta. (\beta^P) = \alpha$.
- Although axiom *cqt-5* can be stated without modification, it is not a suitable formulation for the embedding. Instead the seemingly stronger version *cqt-5-mod* is stated as well. On a closer look, though, *cqt-5-mod* immediately follows from the original *cqt-5* together with the omitted *cqt-2*.

9.7 Identity

Remark 22. For the following proofs first the definitions for the respective identities have to be expanded. They are defined directly in the embedded logic, though, so the proofs are still independent of the meta-logic.

11 Artificial Theorems

Remark 24. *Some examples of theorems that can be derived from the meta-logic, but which are not derivable from the deductive system PLM itself.*

locale *ArtificialTheorems*
begin

lemma *lambda-enc-1*:

$[(\lambda x . \llbracket x^P, F \rrbracket \equiv \llbracket x^P, F \rrbracket, y^P) \text{ in } v]$
by (*auto simp: meta-defs meta-aux conn-defs forall- Π_1 -def*)

lemma *lambda-enc-2:*

$[(\lambda x . \llbracket y^P, G \rrbracket, x^P) \equiv \llbracket y^P, G \rrbracket \text{ in } v]$
by (*auto simp: meta-defs meta-aux conn-defs forall- Π_1 -def*)

Remark 25. *The following is not a theorem and nitpick can find a countermodel. This is expected and important because, if this were a theorem, the theory would become inconsistent.*

lemma *lambda-enc-3:*

$[(\lambda x . \llbracket x^P, F \rrbracket, x^P) \rightarrow \llbracket x^P, F \rrbracket \text{ in } v]$
apply (*simp add: meta-defs meta-aux conn-defs forall- Π_1 -def*)
nitpick[*user-axioms, expect=genuine*]
oops — countermodel by nitpick

Remark 26. *Instead the following two statements hold.*

lemma *lambda-enc-4:*

$[(\lambda x . \llbracket x^P, F \rrbracket, x^P) \text{ in } v] = (\exists y . \nu\nu y = \nu\nu x \wedge [\llbracket y^P, F \rrbracket \text{ in } v])$
by (*simp add: meta-defs meta-aux*)

lemma *lambda-ex:*

$[(\lambda x . \varphi(x^P), x^P) \text{ in } v] = (\exists y . \nu\nu y = \nu\nu x \wedge [\varphi(y^P) \text{ in } v])$
by (*simp add: meta-defs meta-aux*)

Remark 27. *These statements can be translated to statements in the embedded logic.*

lemma *lambda-ex-emb:*

$[(\lambda x . \varphi(x^P), x^P) \equiv (\exists y . (\forall F . \llbracket F, x^P \rrbracket \equiv \llbracket F, y^P \rrbracket) \ \& \ \varphi(y^P)) \text{ in } v]$
